

Camera-only end to end: measuring a 549.0 mm span

Ten pool frames; a grey line joins one frame's three readings, so its horizontal run is the models' disagreement about range. The uncorrected model reads every range 26 % short — the $1/n_w$ it omits — while the corrected two agree to 0.6 %. Median +0.3 / -0.2 / -0.3 %; worst 1.8 / 1.6 / 1.6 %, in legend order.
